```python
print("-----Program for printing student name with marks using list-----")
# create an empty dictionary
D = {}
n = int(input('How many student record you want to store?? '))
# create an empty list
# Add student information to the list
ls = []
for i in range(0, n):
    # Take combined input name and
    # percentage and split values
    # using split function.
    x,y = input("Enter the student name and it's percentage: ").split()
        # Add name and marks stored in x, y
    # respectively using tuple to the list
    ls.append((y,x))
        # sort the elements of list
# based on marks
ls = sorted(ls, reverse = True)
print('Sorted list of students according to their marks in descending order')
for i in ls:
     # print name and marks stored in
    # second and first position
    # respectively in list of tuples.
    print(i[1], i[0])
```
